

Revolutionary Document Management

Keeping Everyone On The Same Page

How do your users share documents? Is your security structure no longer relevant due to email attachment concerns? How easy is it to find, retrieve and share documents? Eprise Docs will empower your users and strengthen your developers.

Eprise Docs

a SilkRoad technology

SilkRoad technology, inc. is proud to introduce Eprise Docs™, a document management system fully integrated with our award winning content management system, Eprise. The Eprise Docs system continues our commitment to enabling the seamless and simple management of the flow of information throughout an organization. This builds upon our Ease of Use and Ease of Management traditions further empowering business users and increasing the efficiency of IT professionals.

simple document management

Intuitive Interfaces

Eprise Docs enables document management to occur within familiar interfaces. This includes an extension to Windows Explorer that exposes a remote document tree as another node along with a custom toolbar to activate functions. Document submission may also occur by emailing a document to the system. Document sharing may occur by virtually attaching a document to an email, enabling consistent enforcement of security and reducing network bandwidth usage. Finally, a full web interface for adding, browsing, retrieving and sharing documents is available for remote users.

Core Document Management Capabilities

Eprise Docs offers core library services that are vital for any document management system. These include check-in, check-out, version control, roll-back, meta-data management and workflow. All of this functionality is accessible through our easy-to-use interface that branches within Windows Explorer.

full-text searching

Eprise Docs enables searching to go well-beyond just searching titles and meta-data. A full index of the documents submitted into the system is created and keywords are dynamically created based upon the content of the document. These keywords are searchable as well as the full-text of the documents, upon the option of the user.

Empowering Developers

At SilkRoad technology, we realize that document management solutions get nowhere without the developers and IT professionals who manage them. As such, we have focused considerable effort on creating a flexible and powerful architecture that increases developer efficiency.

easy system management

Integrated Security

The Eprise Docs role-based security system is fully integrated with our Eprise product. Security may be run through our proprietary system, LDAP, Active Directory, Netegrity SiteMinder or a hybrid solution. Further, Eprise Docs enables corporations to distribute permissions through recursive role delegation. This means that the IT department can delegate a sub-set of permissions to Marketing, who can delegate a sub-set to Business Units, who can delegate to a fourth party and so on.

Rules and Triggers

In addition to role-based usage controls, folders can have rules for data that is added to them. For example, a folder may be restricted to only allow image files. Further, when a document is dropped into a folder, events may be triggered. This includes prompting a user to enter meta-data, notifying users of the new material, or starting a workflow process.

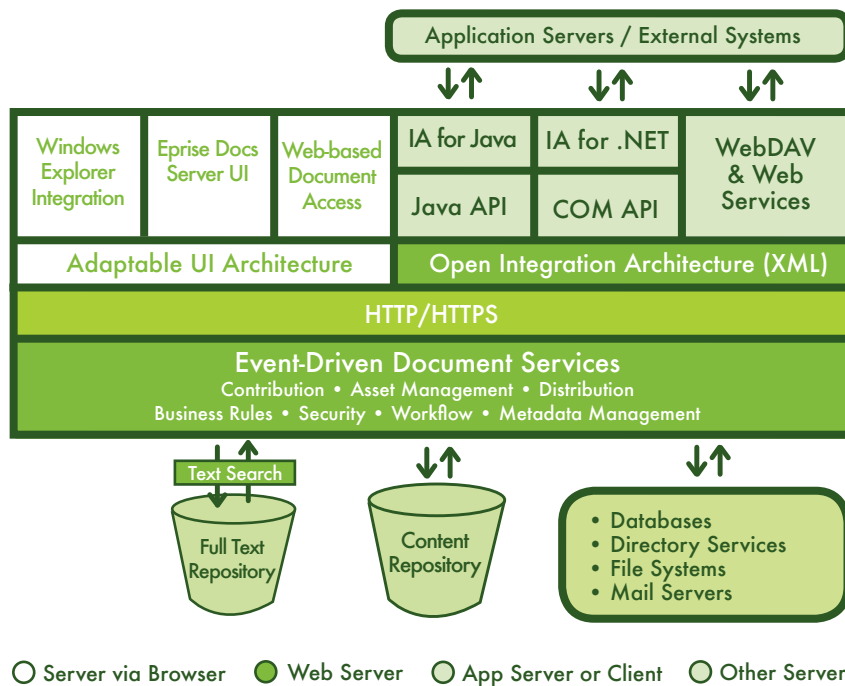

strong developer toolset

Web Services Integrations

The architecture landscape is changing as web services gain more traction and acceptance within enterprise development. As such, Eprise Docs enables both the consumption of web services and exposes Eprise Docs functionality as callable web services.

Rapid Deployment

Eprise Docs offers integration solutions for rapidly deploying document and content solutions connected to enterprise applications. A flexible architecture supports complex environments while allowing businesses to put data directly in the hands of knowledge experts. Eprise Docs integrates directly with popular application servers as well as having available web services, com and java based integration interfaces.
